Overview Section

Project Charter

Define project background

The School of Information Studies at Syracuse University has a large amount of data that needs to be analyzed. Based on feedback from both end-users and staff in the school, people are disappointed with the enrollment process. Oftentimes, classes are filled immediately after the enrollment period opens, but by the time the first day of class comes, and again after the first couple of weeks of classes have passed, many students have dropped their respective classes, leaving empty spots where others might have enrolled, but now it is too late.

This project will use data from the School of Information Studies' database to increase the efficiency of the student enrollment processes. The project team will create dimensional models within a data warehouse to aid in making the final recommendations.

Project Scope

This project's scope will focus on several areas, including:

- Recommending, designing, building, and implementing a data warehouse for the School of Information Studies to help better plan their enrollment processes
- Analyze enrollment data for both online and in-person classes along with the respective drop rates and waitlist numbers for each class
- Create findings that include an overall documentation of each class that gets dropped by term (transactional), how many classes are dropped in online classes versus in person classes (periodic snapshot), and how many people that sit on a waitlist end up enrolling in a class (accumulating snapshot).
- No new attributes will be added to existing data. Only the real-time data that is currently collected will be used.
- Answer whether the School of Information Studies should purposely over-enroll classes to protect against empty seats after people drop the class. Answer if online courses experience higher drop rates than in person courses.
- Only looking at solutions for the School of Information Studies
- Deliver the Business Intelligence tool using Excel or similar program
- Create a poster for presentation to be delivered to Professor Fudge

Success Criteria

A successful project will answer the following questions adequately:

- Based on waitlist data, which iSchool courses warrant additional sections?

- Based on enrollment data, which iSchool course sections should be dropped in future semesters?

Business Justification

This project will benefit the School of Information Studies in several ways. When students are unable to enroll in a course because it is full, they may be frustrated and end up signing up for a class that was not their top choice. This dissatisfaction could result in lower grades due to a lack of motivation. It could also lead to a student feeling that the experience at the School of Information Studies was not good, potentially negatively affecting future recruitment efforts.

The School of Information Studies also wants to fill its classes as much as possible. If classes are experiencing high drop rates, seats that would have otherwise been filled may stay empty. This presents an inefficiency for the School of Information Studies. Even those students who choose to sit on a waitlist in hopes that other students drop, may end up enrolling in a different class, and ultimately will not accept their opportunity to join the class they originally wanted.

Team Member Roles and Responsibilities

Roles and responsibilities for the project were split up amongst the group members. Though each group member had specific tasks with which they were responsible, all group members weighed in on every aspect of the project and had a hand in the project's ultimate success. Work was well distributed, and each group member met deadlines. The work responsibilities were distributed as follows:

Business Lead: Sam Edelstein and Garnette Pereira

Project Manager: Sahil Baxi and Qiong Wu

Data Architect: All

ETL: Sahil Baxi and Gaurav Shinde

Business Analyst: Gaurav Shinde and Qiong Wu

Business Intelligence: Sam Edelstein and Garnette Pereira

Key Stakeholders

This project focused on enrollment analysis for the School of Information Studies at Syracuse University and was completed for Professor Michael Fudge. The key stakeholders for this project are:

- **School of Information Studies Dean and other leadership** – Analysis helps to answer how to dedicate limited faculty resources to class sections and which courses are over or under-enrolled. The leadership needs to know long term trends to help better plan for future courses and faculty workload.
- **School of Information Studies faculty** – The faculty can track how their class enrollment numbers compare to other similar class sections and can see why they would be asked to teach different courses because of student demand.
- **School of Information Studies enrollment management and counselors** – The analysis will give a better sense of the types of courses other students are taking and will result in better advice about the types of courses that will be available.
- **School of Information Studies students** – Students are eager to enroll in the class sections they need to fill requirements and that are essential to their education to help with a future career. More course sections in classes that have consistently high demand and fewer course sections of course that have low demand will enable every student to enroll in the classes they need to graduate.
- **Syracuse University administration** – Though this exact model would not apply to schools and colleges outside of the iSchool, similar models could be built across Syracuse University to ensure efficient allocation of resources when it comes to class sections. Particularly for undergraduate students who tend to take classes in many different schools, ensuring the appropriate number of seats, and professors, are available is critical to a well-functioning university.

Analysis Section

Business processes

The business process for this project focuses on enrollment analysis. All associated details are listed below. The files can also be found in the attached documents:

- Project-High-Level-Worksheet.xlsx

Bus matrix

The matrix shown above represents iSchool Enrollment business processes and its associated dimensions. This matrix is a blueprint for our Data Warehouse/Business Intelligence data organization. Each row in the matrix represents a business process, while each column corresponds to a dimension of the business. The matrix cells marked with an 'X' indicate which columns are associated with each row.

| Business Process Name | Fact Table | Fact Grain Type | Granularity | Facts | Term | Instructor | ClassSection | DayJunk |
|-----------------------|----------------|-----------------|---|--|------|------------|--------------|---------|
| EnrollmentAnalysis | FactEnrollment | Transaction | One row means per class section at one term | CountCapacity, CountEnrolled, CountWaitlist, CountAvailable, CpuntKPIClass | X | X | X | X |

Bubble Chart

Above is an example of a high-level model diagram shown through the graphical design of a bubble chart. It shows the dimensional model relationship with fact table in the middle and other five dimensions surrounding. This particular

bubble chart shows the fact and dimension table applicable to the enrollment analysis business process.

Attribute List

The Attributes and Metrics List break down each dimension and fact into further detail. The dimensions contain descriptions of the attributes of each dimension to include: examples of the data found in those fields of information, and alternative names and/or descriptions in which the data may be seen. The fact tables contain attributes and foreign keys, which reference the primary keys in other dimensions. These primary and foreign keys are important to establish, as they will be referenced through the dimensional model. This list also allows the design team to further understand how the dimensions will work with one another in support of the business processes.

| Dimension / Fact Table | Attribute / Fact Name | Description | Alternate Names | Sample Values |
|---------------------------|--------------------------|---------------------------------------|--------------------|---------------------|
| DimTerm | termKey | Primary Key | | 1 |
| DimTerm | termId | Natural Key | | 1141 |
| DimTerm | termName | Term Description | | Spring 2015 |
| DimTerm | TermAcademicYear | Term Acedemic Year | | 2014-2015 |

Team Contribution Report

For this project, each team member had specific responsibilities, but all team members also worked collaboratively and stepped in to help in all aspects of the project when needed. The team held, at minimum, weekly meetings outside of class time to discuss the project and stay on task. At these meetings, work was completed and expectations were set for future meetings. All group members came to every meeting as long as they were available, and everyone played a part in ensuring project success.

Implementation

Rolap Schema in SQL Server

For this project, all data loaded into SQL Server can be found in the siedelst_stg and siedelst_dw databases.

SSIS ETL Code / Packages

All files related to SSIS ETL Code and packages can be found in the attached files:
Group B Project.sln

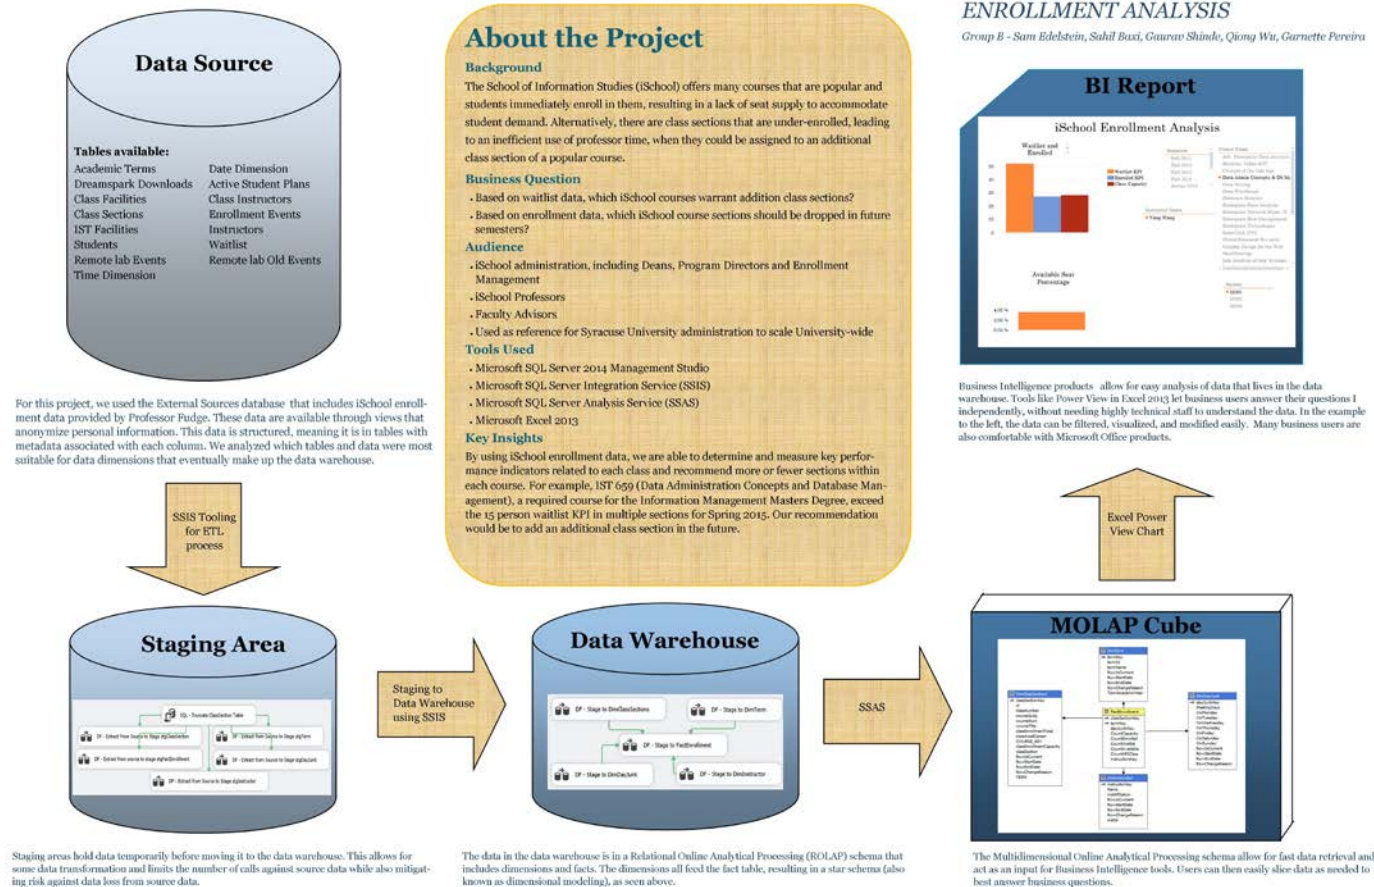

Analysis Services MOLAP Database

All files related to Analysis Service and the MOLAP database can be found us the ist722_siedelst database.

BI Front End

Excel 2013 was used, along with PowerPivot and Power View to serve as front end Business Intelligence. The Excel file is attached, and titled Visualize.xlsx.

Poster

See "Group B Poster-Sahil.pdf" for a more detailed version of the poster
